## YEAR 10 - DELVING INTO DATA... <br> @uhisto_maths

## I What do I need to be able to do?

|
| By the end of this unt you should be abe to:
1- Construct and interpret frequency tables
and polygon two-way tables, line, bar, \& pie charts
I. Find and interpret averages from a list and

## a table

1. Construct and interpret time series graphs, stem and leaf diagrams and scatter graphs

## Keywords

Population: the whole group that is being studied
I Sample: a selection taken from the population that will let you find out information about the larger group
I Representative: a sample group that accurately represents the population
I Random sample: a group completely chosen by change No predictability to who it will include.
Bias: a buitt-in error that makes all values wrong by a certain amount

- Primary data: data collected from an original source for a purpose.

Seconsdary dataa datat taken from an extemal boation Not colected drectly

1) autier: a value that stands apart from the data set

| Two way tables $R$ | Subgroups each have their own heading |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 60 people visted the zoo one Saturday moming 26 of them were adults. 13 of the adult's favourte animal was an elephant 24 of the children's favounte animal was an elephant. |  | adut | Child | Total |  |
|  | Elephant | 13 | 24 | 37 |  |
|  | Other | 13 | 10 | 23 |  |
| Extract information to input to the two-way table. | Needs subgroup totak |  |  | Overall total |  |

[^0]
## Frequency tables and polygons

I The data in a list: $0,0,0,0,0,0,0,1,1,1,1,1,1,1,1,2,2,2,2,2$

> Mean: total number of sibinoss

I Grouped data

| $x$ <br> Weight(g) | Frequency | Mid Point | MP $\times$ Freq |
| :---: | :---: | :---: | :---: |
| $40<x \leq 50$ | 1 | 45 | 45 |
| $50<x \leq 60$ | 3 | 65 | 195 |
| $60<x \leq 70$ | 5 | 65 | 325 |

The data in a list $45,55,55,55,65,65,65,65,65$

## Two way tables $R$

60 people visted the $z 00$ one Saturday moring 26 of them were adults 13 of the adul's favourte animal was on elephant 24 of the chidren's favourte animal was on elephant

## year 10 －delung into data．．． <br> ＠uhisto＿maths

What do I need to be able to do？
｜By the end of this unt you should be able to：
1－Construct and interpret frequency tables
and polygon two－way tables，ine，bar，\＆pie I charts
I．Find and interpret averages from a list and
－Construct and interpret time series graphs， stem and leaf diagrams and scatter graphs

## Keywords

Population：the whole group that is being studied
Sample：a selection taken from the population that will let you find out information about the larger group
Representative：a sample group that accurately represents the population
I Random sample：a group completely chosen by change．No predictability to who it will include．
Bias：a buit－in error that makes all values wrong by a certain amount
Primary data：data collected from an original source for a purpose．
Secondary data：data taken from an external location Not colected directly
I Outier：a vave that stanos apart from the data set

## IStem and leaf a nay to reperesent dita a and se to form wereraes

This stem and leaf diagram shows the age of people in a line at the supermarket．

## Draw and interpret a scatter graph．

| Age of Car（Years） | 2 | 4 | 6 | 8 | 10 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Value of Car（£s） | 750 | 6250 | 4000 | 3500 | 2500 |

1．This data may not be given in size order
－The data forms information pairs for the scatter graph

## The line of best fit $R$

I The Line of best fit is used to make estimates about the information in your scatter graph

## Things to know

The line of best fit DOES NOT need to go through the origin（The point the axes cross）
－There should be approximately the same number of points above and below the ine It may not go through any points）
－The ine extends across the whole graph

It is only an estimate
because the line is
designed to be an average
representation of the data
It is always a straight line．

Using a lime of best fit ©

Interpolation is using the line of best fit to estimate values inside our data point．
eg 40 hours revising predicts a percentage of 45

Extrapolation is where we use our line of best fit to predict information outside of our data ＊＊This is not always useful－in this example you cannot score more that $100 \%$ So revising for longer can not be estimated＊＊

## This point is an＂outier＂

It is an outlier because it doesn＇t fit this model and stands apart from the data

[^0]:    II Draw and interpret Pie Charts $R$

    | Type of pet | Dog | Cot | Hamster |
    | :--- | :--- | :--- | :--- | :--- |$\quad$| There were 60 people asked in this survey |
    | :--- |
    | Freevency |
    | 32 |

    Comparing Pie Charts: represents dogs $\frac{32}{60} \times 360=192^{\circ} \quad \begin{array}{r}\text { Use a protractor to draw } \quad \begin{array}{l}\text { YEED the overall } \\ \text { frequency to make any }\end{array}\end{array}$

    Ths is $192^{\circ}$
    
    averaces from lits $B$

    The Mean
    a measure of average to find the central tendency.. a typical value that represents the data
    $24,8,4,11,8$,

    Find the sum of the data (add the values) 55
    Divide the overall total by how many pieces of data you have
    $55 \div 5$
    Mean $=11$

    The Mode (The modal value)
    This is the number $O R$ the item that occurs the most it does not have to be numerical

    ## The Median

    The vave in the center in the modde) of the data

    ## 24, 8, 4, II, 8,

    ## 24, 8, 4, II, 8,

    This can still be easier if it the data is ordered first

    Put the data in order $\quad 4,8,8,11,24$
    Find the value in the midolle $4,8,8,11,24$
    Median $=8$

    Mode $=8$

    NOTE:If there s no single midele vate find the mean of the two numbers eft

    For Grouped Data
    The modal group - which group has the highest frequency
