

Aim For Excellence'

Aluminium alloys are low density.

Ceramics, polymers and composites	Polymers	Thermosetting	Thermosoftening	Aluminium alloys are low density.
<ul style="list-style-type: none"> polymers that do not melt when they are heated. polymers that melt when they are heated. 	<ul style="list-style-type: none"> Soda-lime glass, made by heating sand, sodium carbonate and limestone. Borosilicate glass, made from sand and boron trioxide, melts at higher temperatures than soda-lime glass. MDF wood (woodchips, shavings, sawdust and resin) Concrete (cement, sand and gravel) 	<ul style="list-style-type: none"> A mixture of materials put together for a specific purpose e.g. strength 	<ul style="list-style-type: none"> Made from clay 	<ul style="list-style-type: none"> Made by shaping wet clay and then heating in a furnace, common examples include pottery and bricks.

L103 - 104 Using resources 2 (CHEM ONLY)

The Haber process and the use of NPK fertilisers

The Haber process – conditions and equilibrium

Phosphate rock	The reactants side of the equation has more molecules of gas. This means that if pressure is increased, equilibrium shifts towards the production of ammonia (Le Chatelier's principle). The pressure needs to be as high as possible.
Treatment	Products
Nitric acid	The acid is neutralised with ammonia to produce ammonium phosphate, a NPK fertiliser.
Sulfuric acid	Calcium phosphate and calcium sulfate (a single superphosphate).
Phosphoric acid	Calcium phosphate (a triple superphosphate).

The Haber process

The Haber process	Used to manufacture ammonia	Ammonia is used to produce fertilisers
Raw materials	Nitrogen from the air while hydrogen from natural gas	Nitrogen + hydrogen \rightleftharpoons ammonia

Both of these gases are purified before being passed over an iron catalyst. This is completed under high temperature (about 450°C) and pressure (about 200 atmospheres).

The catalyst speeds up **both** directions of the reaction, therefore not actually increasing the amount of valuable product.

Production and uses of NPK fertilisers

NPK fertilisers	Formulations of various salts containing appropriate percentages of the elements.
Fertiliser examples	Phosphate rock needs to be treated with an acid to produce a soluble salt which is then used as a fertiliser. Ammonia can be used to manufacture ammonium salts and nitric acid.

Corrosion and its prevention

A mixture of two elements, one of which must be a metal e.g. Bronze is an alloy of copper and tin and Brass is an alloy of copper and zinc.

Carats

Gold

Alloys of iron, carbon and other metals.

High carbon steel is strong but brittle.

Low carbon steel is softer and easily shaped.

Steel containing chromium and nickel (stainless) are hard and corrosion resistant.

Alloys are useful materials

Steel is strong but brittle.

Low carbon steel is softer and easily shaped.

Steel containing chromium and nickel (stainless) are hard and corrosion resistant.

Alloys of iron, carbon and other metals.

High carbon steel is strong but brittle.
